- 10 extra Cyclone Cassettes (25mm)
- 5 x Plastic Filter Transport cassettes (25mm)

Castle provides a range of ready made air sampling kits for the main applications of dust/particulate and gas/vapour sampling. If you are new to sampling, looking to update your equipment or simply too busy to find out what you need from our extensive range, Castle can help.

Castle Air Sampling Kits come with a choice of one or five pumps, and range from an upgradeable basic version, to a comprehensive particulate and vapour sampling system.

How do I buy the correct kit for me?

Buying a kit could not be simpler. Ask yourself some questions, note the relevant Castle codes and the choice is made.

1. What features do you require in your sampling pump?
2. What type of hazards will you be collecting now or in the future?

What else do I need?

When you have chosen the kit, you will need to add a calibration device. Kits do not include this because we want you to choose from the range of units based on the level of accuracy and price to suit your own needs.

You will need media to sample onto.. If you are unsure what media is required take a look at the Castle comprehensive air sampling guide.

We also offer training courses, take a look at our Personal Air Sampling and COSHH Competent Person course and our COSHH & Air Sampling Roadshows.

Details and upcoming courses can be found on the Training page of our website:

Defender Electronic Primary Flow Calibrator

The new replacement for the popular and proven DC-Lite. With a wide range of major improvements it is the easiest flow calibrator on the market today. Calibrations within 1 minute and no messy liquids.

Other calibrators are available where the full features of the Defender are not required.

Castle offer a full range of kits from the Basic Starter, a good entry level product containing just the bare essentials to get you started, to a full Five Pump kit all offered with the pump of your choice.
